

How is the relationship between 2015 house pricing (€/m2) and 2015 elections to City Hall for districts?

- Ahora Madrid has the greatest vote share in top 9 districts with lowest house pricing. (Puente de Vallecas has highest share with 41.9%, Carabanchel has the lowest share with %33.9 among those 9 districts.)
- I clicked for 9 most cheapest housing prices, than I realized those districts' first choice was Ahora Madrid for the election.

How is the relationship between car per 100 inhabitants/per person and 2015 elections to City Hall for districts?

- Except for *San Blas-Canillejas* and *Moratalaz*, PP has the greatest vote share in all districts with higher than average car number per 100 inhabitants (>39.6)
- These two exceptions voted for Ahora Madrid.
- I chose districts with higher than average car number per 100 inhabitants, than analyzed them on the election table. I realized, except two districts, they voted for PP in the first place.

How is the relationship between population distribution and foreign people?

- Top 4 districts with highest percentage of foreigner population have greater population distribution for 40-44 age group than Madrid average. (>4.3% for both male and female)
- All these districts also take place on the west side of the city.
- I chose top 4 districts on the first graph and visually realized the middle-aged population distribution is higher than the city average, then I checked the data on the population pyramids for accuracy.
